Underlined text indicates ISO 27002 Domains

Blue text indicates resilience and metric elements

ISMS Best Practices are part of the ideal all IT executives and personnel strive toward. The effort is never ending.

Collectively, ISMS Best Practices represent the framework(s) and functional integration of standards, policies, procedures, organizational structure, tools, skills, knowledge and resources that provide optimal value to an organization: The Value Proposition.

From an administrative perspective, the central values are cost effectiveness, service orientation (usability and functionality), security, risk management, enhanced productivity and growth/profitability.

From a workforce member perspective, the central values are privacy, accessibility, and experience satisfaction.

From an IT security perspective, the central values are confidentiality, integrity, availability and trust.
